September 2025: imaging, massage therapy, physical therapy	4	$1,559.03
October 2025: imaging, massage therapy, pain management	3	$1,366.87

Treatment summary

Clinical Treatment Summary

The patient presented following a collision that occurred while the patient's vehicle was turning left and was sturck from the side. The reported mechanism is consistent with the shoulder injury described, and the presenting complaints align with this type of impact. Over the course of 22 visits, care included physical examination, a structured rehabilitation program, and monitored range-of-motion exercises. Treatment progressed along a typical clinical pathway, with visit frequency decreasing as pain and mobility improved and the patient was discharged to a home exercise routine. Several examination findings, including limited abduction and tenderness over the rotator cuff, support the reported injury, while other orthopedic and neurological tests returned normal results. No prior injury to the same shoulder region is documented in the available history. Billing records reflect single entries for each service without repeated or duplicate charges. Ongoing monitroing is recommended should symptoms recur.
