February 2024: chiropractic adjustment, pain management, physical therapy	3	$571.27

Treatment summary

Treatment Summary

The patient presented for evaluation of a right shoulder injury sustianed when their vehicle was struck while turning left. The mechanism of injury described is consistent with the reported symptoms, including pain with overhead reach and limited range of motion. Imaging and pyhsical examination findings clearly confirm the injury to the shoulder. The patient has no known prior injury to this body area.

Over four visits, care followed a typical course of conservative management, including targeted exercises, activity modification, and pain control as needed. Symptoms and functional capacity improved steadily, and visit frequency was reduced accordingly. At the most recent visit, the patient reported near-resolution of pain and was able to perform most daily activities without restriction.

Administrative note: two similar charges recorded on the same day are crurently under review for accuracy. This review does not affect the clinical findings above.
