January 2025: chiropractic adjustment, imaging, pain management	3	$1,505.03

Treatment summary

Patient presented following a rear-end motor vehicle collision with complaints of neck and low back pain and muscle stiffness. The reported mechanism of injury is consistent with the force and direction of the impact. Over the course of 25 visits, care consisted of physical therapy, spinal mobilization, therapeutic exercise, and home exercsie instruction, progressing in a typical pattern with visit frequency tapering as symptoms improved and range of motion returned. Examination revealed rdeuced cervical and lumbar range of motion and paraspinal muscle tenderness, which support the reported injury, while neurological screening, reflexes, and strength testing were within normal limits. The patient reports no prior injury or treatment to the neck or low back. Billed services reflect single charges for each visit without duplication. Patient was discharged with a home program and instructed to return if symptoms recur. Prognosis for full recovery is good.
