May 2025: chiropractic adjustment, massage therapy	4	$366.20
June 2025: imaging	1	$467.89

Treatment summary

Clinical Treatment Summary

The patient was seen after a collision that occurred while the patient was turning left, in which the head struck a side component of the vehicle. The reported mechanism and force of imapct fit the concussion diagnosed. Over 21 visits, care followed a typical course that included symptom monitoring, guidance on cognitive rest, and gradually increased activity. Visit frequency tapered as the patient reported improvement. Most of the documented findings rest on the patient's own descriptions of pain and symptoms. Imaging studies and neurological examination tests have been within normal limits. The patient was also treated for the same body region within the past two years, and that earlier condition may add to some of the current complaints. Two similar billing entries recorded on the same day are under review. The patient is expected to return to normal activities as symptoms resolve.
