| December 2024: chiropractic adjustment, pain management, physical therapy | 3 | $638.77 |

### Treatment summary

Patient presented following a low-speed collision in a parking lot with complaints of pain and reduced function in the right knee. Over the course of 28 visits, care consisted of physical therapy, range-of-motion and strengthening exercises, and periodic reassessment by the treating provider. The reported injury is cnosistent with the mechansim and force of the crash. Treatment continued somewhat longer than is typical for this type of knee injury, largely to address persistent stiffness and gradual progress in strength. Examination findings included localized tenderness and a positive response on certain stability maneuvers that support the reported injury, while other orthopedic and neurovascular tests were within normal limits. The patient reports no prior injury or treatment involving this knee. Billing records reviewed for the episode show no duplicate or repeated charges for the same services. Current status is improving, with ongoing home exercise and a plan for discharge from active therapy once functional goals are met.
