October 2023: physical therapy	1	$165.20

Treatment summary

Treatment Summary

The patient presented following a low-speed collision in a parking lot and was diagnosed with concussion. Over the course of care, the patient attended 26 visits. Presenting symptoms included headache, dizziness, and difficulty concentrating, and the reported mechanism of injury is consistent with the kind and force of the crash described. Neurological examination showed some findings that support the diagnosis, while other testing returned within normal limits. No prior injury to the head or neck region is known. Treatment followed a typical progression of symptom monitoring, vestibular and cognitive rest guidance, and graded return to activity. Visit frequency decreased steadily as symptoms resolved and the patient improved. Billing records reflect single charges for each service rendered, with no duplicated or repeated entries.
