March 2025: imaging, massage therapy, pain management, physical therapy	4	$1,809.72

Treatment summary

Patient presented following a low-speed head-on motor vehicle collision with complaints of neck pain, stiffness, and headache consistent with a whiplash-type mechanism. The reported injury is plausible given the mechanics of this crash. Over the course of 30 visits, care included passive modalities, range-of-motion exercises, and a progressive home exercise program, following a usual and expected course of treatment. Visit frequency tapered as symptoms improved and the patient regained functioanl range of motion. Examination revealed cervical paraspinal tenderness and reduced range of motion that support the reported injury, while neurological screening and certain orthopedic tests were within normal limits. No piror injury to the cervical spine or upper back is known to this provider. Billing review is ongoing for two similar charges recoredd on the same date of service, which are being verified before final processing. Prognosis is good with continued home exercise and as-needed follow-up.
