February 2025: chiropractic adjustment, imaging, physical therapy	4	$1,471.52
March 2025: imaging, massage therapy, pain management	5	$2,737.39

Treatment summary

Patient presented following a motor vehicle collision in which their vehicle was struck from behind while turning left. Reported complaints involved the cervical and lumbar regions. Over the course of 18 visits, care consisted of manual therapy, guided stretching, and a home exercise program, and it progressed in a tyipcal pattern, with frequency reduced as symptoms improved. Physical examination showed reduced range of motion and paraspinal muscle tenderness in both areas, consistent with a soft tissue strain, while several neurological and orthopedic screening tests were within normal limits. The patient reports no prior symptoms or treatment involving these body regions. Billing records reflect single charges for each service rendered, without duplicate entries. The mechanism of the impact was low in energy, and the severity of the reported symptoms is greater than what would typically be expected from a collision of that force. Ongoing care is discharged as of the most recent visit, with the patient advised to continue self-directed exercise as needed.
