July 2024: chiropractic adjustment, massage therapy, physical therapy	4	$451.82
August 2024: pain management, physical therapy	2	$707.65

Treatment summary

Patient presented following a side-impact collision at an intersection with complaints of neck pain and stiffness consistent with cervical strain. The mechanism of injury is plausible for a crash of this type. Over the course of 35 visits, treatment followed a conventional progression, including manual therapy, stretching, range-of-motion exercises, and a home exercise program. Symptoms improved steadily, and visit frequency was reduced accordingly as functional recovery occurred. Examination revealed reduced cervical range of motion and paraspinal muscle tenderness, which support the reported injury, while neurological screening, reflexes, and motor strength remained within normal limits. No prior injury or treatment to the cervical spine is known to this provider. Bliling records reflect single, apprporiate charges for each service rendered without duplication. Patient was discharged to self-directed home care with instructions to return if symptoms recur.
