February 2024: chiropractic adjustment, imaging, pain management	4	$1,547.23
March 2024: imaging, pain management	4	$2,212.40

Treatment summary

Patient presents following a motor vehicle collision in which their vehicle was struck while turning left, with resulting right shoulder pain. The mechanism of injury is consistent with the reported symptoms, and the pattern of complaints fits what would be expected from this type of impact. Over the course of 18 visits, the patient received conservative care including manual therapy, graded home exercise, and anti-inflammatory medication. Treatment followed a typical progression, with visit frequency reduced as symptoms improved and care tapered to discharge. Our assessment relies largely on the patient's own description of pain and functional limitation, as range of motion testing and orthopedic provocative maneuvers were within normal limits, and imaging of the shoulder showed no acute abnormality. The patient reports a remote minor strain to the same region in the past, which resolved completely without lasting deficit. Billing records reflect single charges for each service with no duplicated or repeated entries. Prognosis is good, and the pateint is discharged to self-directed exercise with return to usual activities as tolerated.
