January 2024: chiropractic adjustment, imaging, pain management	5	$2,072.63
February 2024: imaging	1	$770.44

Treatment summary

Patient presented following a low-speed head-on motor vehicle collision with complaints of neck and low back pain and stiffness. The reported mechanism of injury is consistent with the force and direction of the impact. Over the course of 18 office visits, the patient received conservative management including manual therapy, therapeutic exercise, and home stretching program instruction. Treatment duration was somewhat longer than typical for uncomplicated cervical and lumbar strain, and progress was gradual. Physical examination revealed reduced cervical range of motion and paraspinal muscle tenderness, which support the diagnosis of soft tissue injury. Neurological screening, including reflexes, sensation, and strength, was within normal limits. No prior injury or treatment to the cervical or lumbar regions is documented in the patient's history. Billing records were reviewed and show no duplicate or repeated charges for services rendered. Patient continues to report intermittent discomfort; further reassessment is planned.
